

# **Introduction to Software Testing**

## **Chapter 2.4**

### **Graph Coverage for Design Elements**

**Paul Ammann & Jeff Offutt**

[www.introsoftwaretesting.com](http://www.introsoftwaretesting.com)

# OO Software and Designs

- Emphasis on modularity and reuse puts complexity in the design connections
- Testing **design relationships** is more important than before
- Graphs are based on the connections among the software components
  - Connections are dependency relations, also called couplings

# Call Graph

- The most common graph for structural design testing
- **Nodes** : Units (in Java – methods)
- **Edges** : Calls to units

**Example call graph**

**Node coverage** : call every unit at least once (method coverage)

**Edge coverage** : execute every call at least once (call coverage)

# Call Graphs on Classes

- Node and edge coverage of class call graphs often do not work very well
- Individual methods might not call each other at all!

## Class stack

```
public void push (Object o)
public Object pop ( )
public boolean isEmpty (Object o)
```

**Other types of testing are needed – do not use graph criteria**

# Inheritance & Polymorphism

Caution : Ideas are preliminary and not widely used

**Example inheritance hierarchy graph**

Classes are not executable, so this graph is not directly testable

We need objects

**objects**

What is coverage on this graph ?

# Coverage on Inheritance Graph

- Create an object for each class ?
  - This seems weak because there is no execution
- Create an object for each class and apply call coverage?

OO Call Coverage : TR contains each reachable node in the call graph of an object instantiated for each class in the class hierarchy.

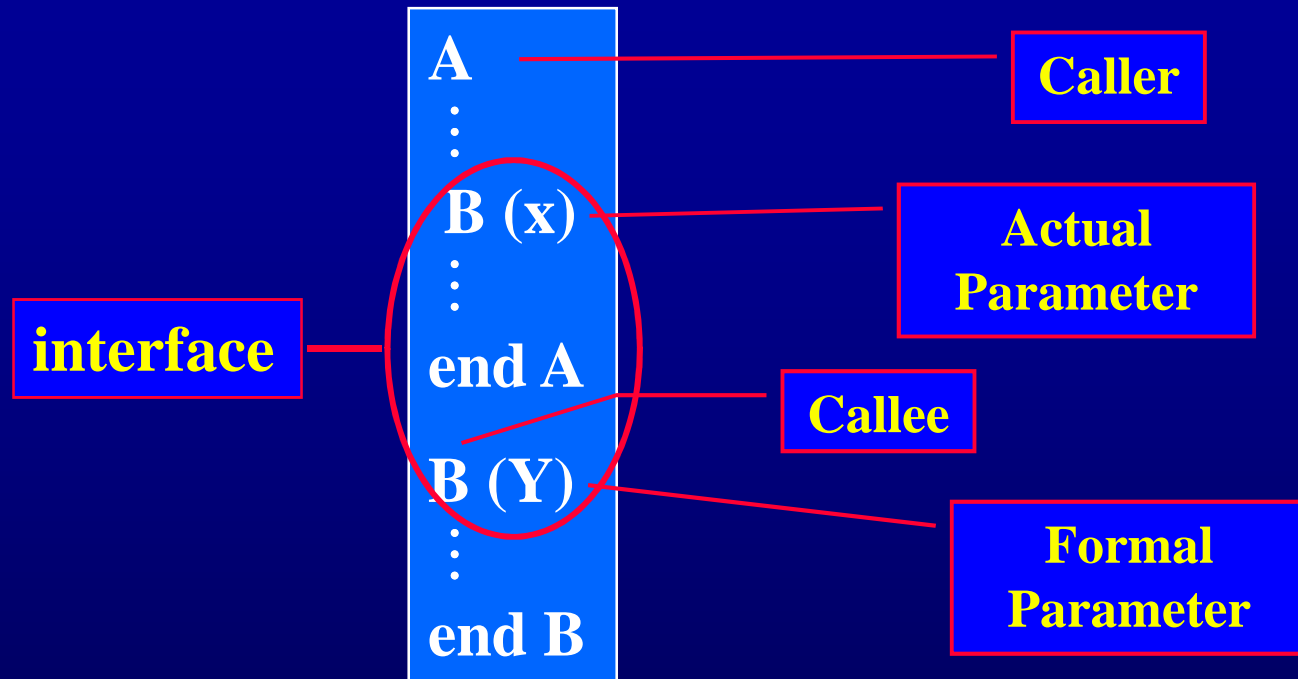

OO Object Call Coverage : TR contains each reachable node in the call graph of every object instantiated for each class in the class hierarchy.

- Data flow is probably more appropriate ...

# Data Flow at the Design Level

- Data flow couplings among units and classes **are more complicated** than control flow couplings
  - When values are passed, they “change names”
  - Many different ways to share data
  - Finding defs and uses can be difficult – finding which uses a def can reach is very difficult
- When software gets complicated ... testers should get interested
  - That's where the faults are!
- **Caller** : A unit that invokes another unit
- **Callee** : The unit that is called
- **Callsite** : Statement or node where the call appears
- **Actual parameter** : Variable in the caller
- **Formal parameter** : Variable in the callee

# Example Call Site

- Applying data flow criteria to def-use pairs between units is too expensive
- Too many possibilities
- But this is integration testing, and we really only care about the interface ...

# Inter-procedural DU Pairs

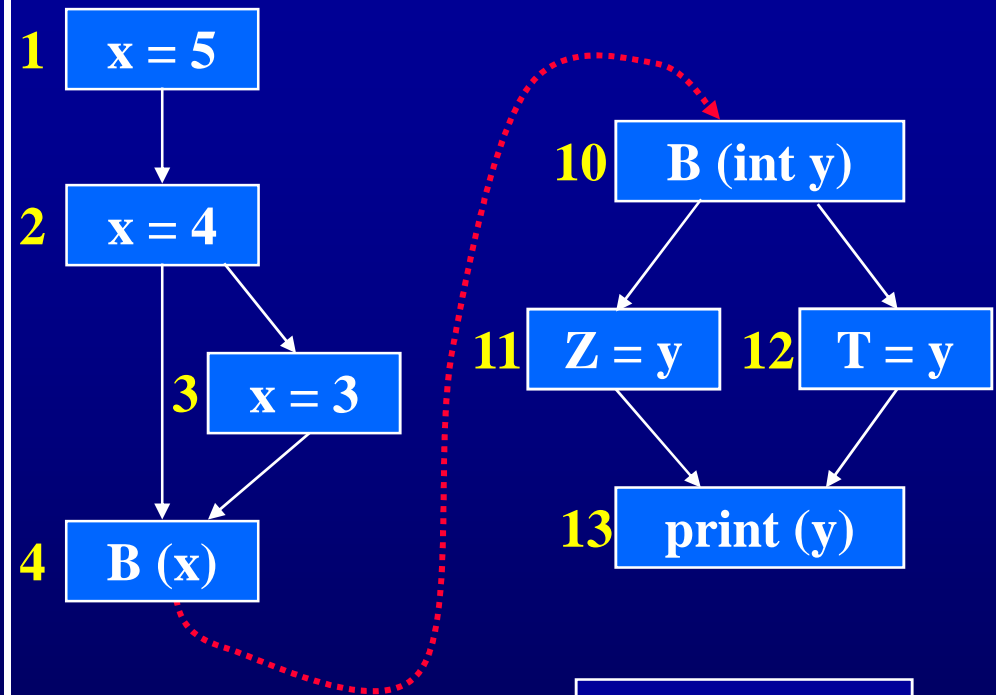

- If we focus on the interface, then we just need to consider the last definitions of variables before calls and returns and first uses inside units and after calls
- Last-def : The set of nodes that define a variable  $x$  and has a def-clear path from the node through a callsite to a use in the other unit
  - Can be from caller to callee (parameter or shared variable) or from callee to caller as a return value
- First-use : The set of nodes that have uses of a variable  $y$  and for which there is a def-clear and use-clear path from the callsite to the nodes

# Example Inter-procedural DU Pairs

**Caller**

**Callee**

Last Defs

2, 3

First Uses

11, 12

# Example – Quadratic

```
1 // Program to compute the quadratic root for
  two numbers
2 import java.lang.Math;
3
4 class Quadratic
5 {
6     private static float Root1, Root2;
7
8     public static void main (String[] argv)
9     {
10         int X, Y, Z;
11         boolean ok;
12         int controlFlag = Integer.parseInt (argv[0]);
13         if (controlFlag == 1)
14         {
15             X = Integer.parseInt (argv[1]);
16             Y = Integer.parseInt (argv[2]);
17             Z = Integer.parseInt (argv[3]);
18         }
19         else
20         {
21             X = 10;
22             Y = 9;
23             Z = 12;
24         }
```

```
25         ok = Root (X, Y, Z);
26         if (ok)
27             System.out.println
28                 ("Quadratic: " + Root1 + Root2);
29         else
30             System.out.println ("No Solution.");
31     }
32
33 // Three positive integers, finds quadratic root
34 private static boolean Root (int A, int B, int C)
35 {
36     float D;
37     boolean Result;
38     D = (float) Math.pow ((double)B,
39                           (double2-4.0)*A*C );
39     if (D < 0.0)
40     {
41         Result = false;
42         return (Result);
43     }
44     Root1 = (float) ((-B + Math.sqrt(D))/(2.0*A));
45     Root2 = (float) ((-B - Math.sqrt(D))/(2.0*A));
46     Result = true;
47     return (Result);
48 } //End method Root
49
50 } // End class Quadratic
```

```
1 // Program to compute the quadratic root for two numbers
2 import java.lang.Math;
3
4 class Quadratic
5 {
6   private static float Root1, Root2;
7
8   public static void main (String[] argv)
9   {
10     int X, Y, Z;
11     boolean ok;
12     int controlFlag = Integer.parseInt (argv[0]);
13     if (controlFlag == 1)
14     {
15       X = Integer.parseInt (argv[1]);
16       Y = Integer.parseInt (argv[2]);
17       Z = Integer.parseInt (argv[3]);
18     }
19     else
20     {
21       X = 10;
22       Y = 9;
23       Z = 12;
24     }
```

**shared variables**

**last-defs**

**first-use**

```
25      ok = Root (X, Y, Z);  
26      if (ok)  
27          System.out.println  
28              ("Quadratic: " + Root1 + Root2);  
29      else  
30          System.out.println ("No Solution.");  
31  }
```

**first-use**

```
32  
33  // Three positive integers, finds the quadratic root  
34  private static boolean Root (int A, int B, int C)  
35  {  
36      float D;  
37      boolean Result;  
38      D = (float) Math.pow ((double)B, (double)2-4.0)*A*C);  
39      if (D < 0.0)  
40      {
```

**last-def**

```
41          Result = false;  
42          return (Result);  
43      }
```

**last-defs**

```
44      Root1 = (float) ((-B + Math.sqrt(D)) / (2.0*A));  
45      Root2 = (float) ((-B - Math.sqrt(D)) / (2.0*A));  
46      Result = true;  
47      return (Result);  
48  } //End method Root  
49  
50 } // End class Quadratic
```

# Quadratic – Coupling DU-pairs

**Pairs of locations:** method name, variable name, statement

(main (), X, 15) – (Root (), A, 38)

(main (), Y, 16) – (Root (), B, 38)

(main (), Z, 17) – (Root (), C, 38)

(main (), X, 21) – (Root (), A, 38)

(main (), Y, 22) – (Root (), B, 38)

(main (), Z, 23) – (Root (), C, 38)

(Root (), Root1, 44) – (main (), Root1, 28)

(Root (), Root2, 45) – (main (), Root2, 28)

(Root (), Result, 41) – ( main (), ok, 26 )

(Root (), Result, 46) – ( main (), ok, 26 )

# Coupling Data Flow Notes

- Only variables that are used or defined in the callee
- Implicit initializations of class and global variables
- Transitive DU-pairs are too expensive to handle
  - A calls B, B calls C, and there is a variable defined in A and used in C
- Arrays : a reference to one element is considered to be a reference to all elements

# Inheritance, Polymorphism & Dynamic Binding

- Additional control and data connections make data flow analysis more complex
- The defining and using units may be in different call hierarchies
- When inheritance hierarchies are used, a def in one unit could reach uses in any class in the inheritance hierarchy
- With dynamic binding, the same location can reach different uses depending on the current type of the using object
- The same location can have different definitions or uses at different points in the execution !

# Additional Definitions

- **Inheritance** : If class **B** *inherits* from class **A**, then all variables and methods in **A** are implicitly in **B**, and **B** can add more
  - A is the *parent* or *ancestor*
  - B is the *child* or *descendent*
- An object reference **obj** that is declared to be of type **A** can be assigned an object of either type **A**, **B**, or any of **B**'s descendents
  - **Declared type** : The type used in the declaration: **A obj**;
  - **Actual type** : The type used in the object assignment: **obj = new B()**;
- **Class (State) Variables** : The variables declared at the class level, often private

# Types of Def-Use Pairs

**intra-procedural data flow**  
(within the same unit)

**inter-procedural**  
**data flow**

**object-oriented direct**  
**coupling data flow**

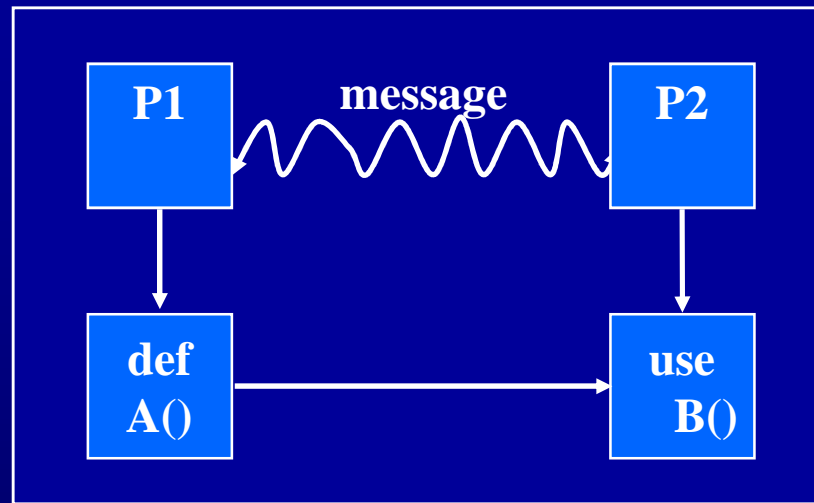

**object-oriented indirect**  
**coupling data flow**

# OO Data Flow Summary

- The defs and uses could be in the same class, or different classes
- Researchers have applied data flow testing to the direct coupling OO situation
  - Has not been used in practice
  - No tools available
- Indirect coupling data flow testing has not been tried either in research or in practice
  - Analysis cost may be prohibitive

# Web Applications and Other Distributed Software

distributed software data flow

- “message” could be HTTP, RMI, or other mechanism
- A() and B() could be in the same class or accessing a persistent variable such as in a web session
- Beyond current technologies
