Western Transportation Institute needs to update its timesheet.

It’s an ASP.NET application written using C# and linked to a SQL database, used to track how much time was spent on various project by the WTI staff, in order to pay the correct amount from every project worked on.

It’s currently running on a VM with Window Server 2008 R2 and SQL 2008.

The candidate needs to check if the current version of the timesheet (application and database) can work under Windows Server 2019 and SQL 2017, and using Visual Studio update it if necessary.

It would be beneficial if the candidate will be able to check if it’s possible to migrate the database from SQL to MySQL.

Western Transportation Institute will provide the timesheet code and the database, the candidate will have to set up a development copy

For more information contact the interim Executive Director of Western Transportation Institute
