CSCI 132: Basic Data Structures and Algorithms

Sorting (Part 4)

Reese Pearsall Fall 2023

Announcements

Program 5 due Sunday December 10th

Lab 12 posted → Fill out the course evaluation

Rubber Duck Extra Credit Posted

Next Wednesday (12/6) is an optional help session for program 5 (no lecture)

Me explaining why my code doesn't work:

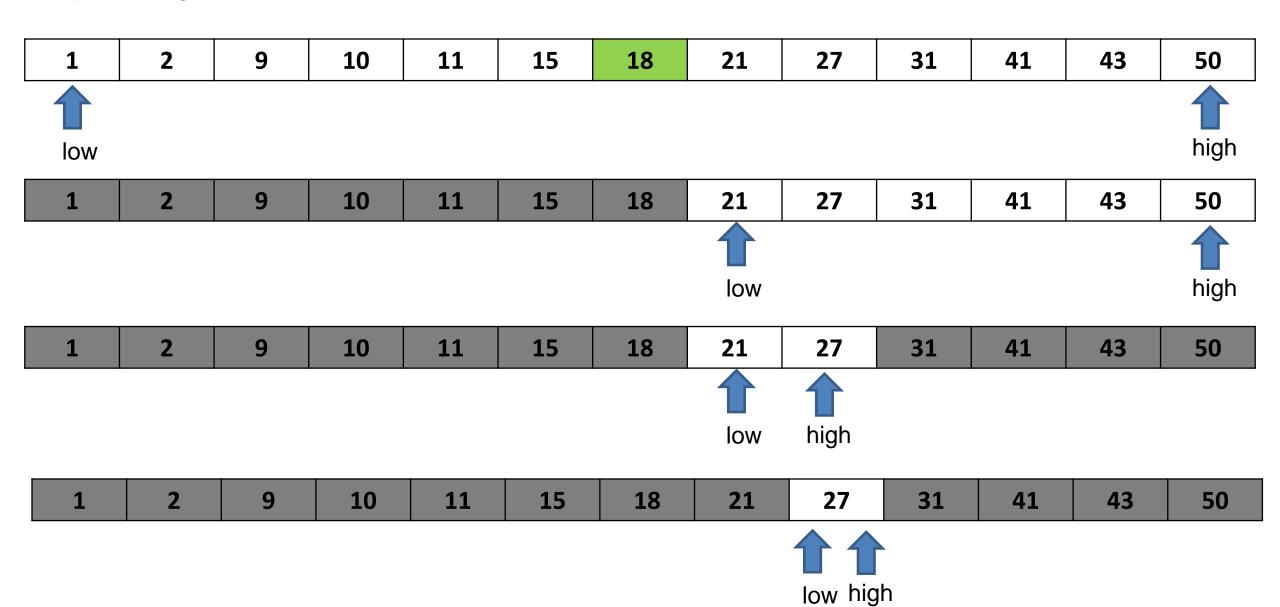

my rubber duck:

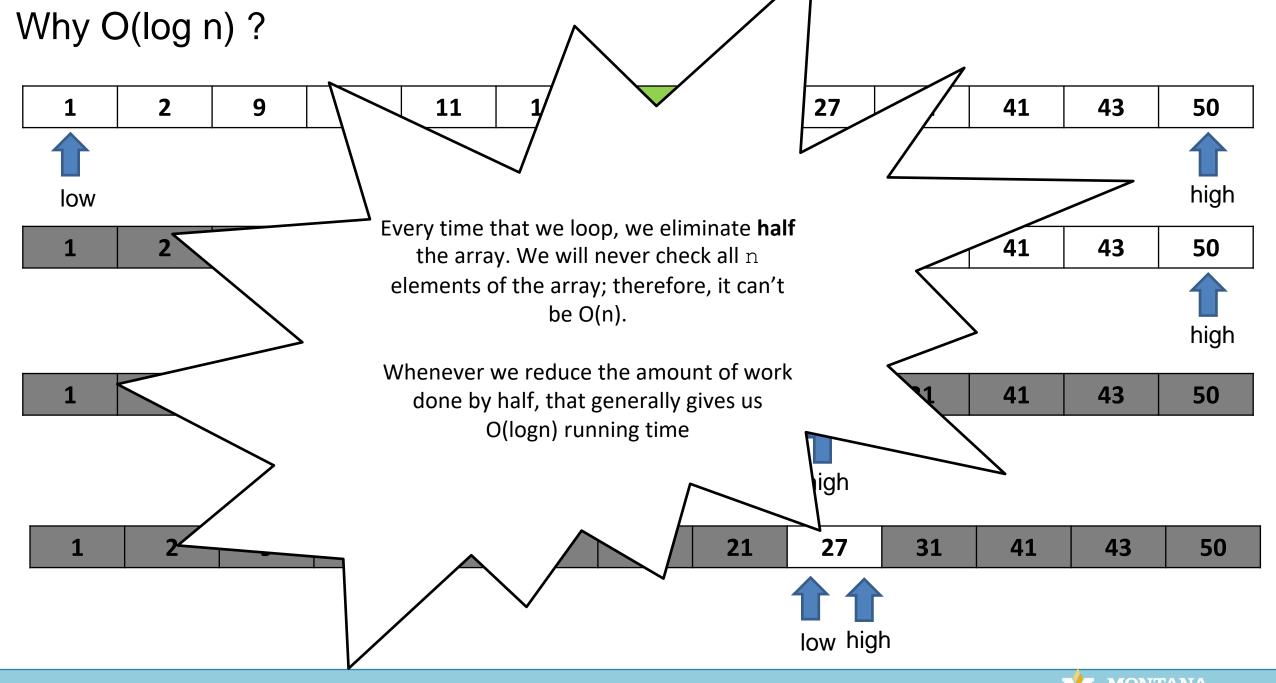

```
private static int binary_search(int[] array, int n) {
       int low = 0;O(1)
      int high = array.length - 1; O(1)
       while(low <= high) { O(log n)</pre>
              int mid = (low + high) / 2; O(1)
              if(n == array[mid]) { O(1)
                     return mid; O(1)
              else if(n > array[mid]) { O(1)
                     low = mid + 1; O(1)
              else {
                    high = mid - 1; O(1)
       return -1; O(1)
```

Running time? O(log n)

Why O(log n)?

```
private static int binary_search(??????????) {
      if(low <= high) {</pre>
             int mid = (low + high) / 2;
             if(n == array[mid]) {
                    return mid;
             else if(n > array[mid]) {
                    return binary_search(????????);
             else {
                    return binary_search(????????);
       else {
             return -1;
```

Binary Search can also be implemented using recursion

```
private static int binary_search_recursive(int[] array, int n, int high, int low) {
       if(low <= high) {
              int mid = (low + high) / 2;
              if(n == array[mid]) {
                      return mid;
              else if(n > array[mid]) {
                      return binary_search_recursive(array, n, high, mid+1);
              else {
                      return binary search recursive(array, n, mid-1, low);
       else {
              return -1;
```

Binary Search can also be implemented using recursion

Proving Correctness of Binary Search

- Lemma (preconditions => postconditions)
 - if binarySearch(E, first, last, K) is called, and
 the problem size is n = (last first + 1),
 for all n >= 0, and
 E[first], ... E[last] are in nondecreasing order,
 - → then it returns -1 if K does not occur in E within the range first, ..., last, and it returns index such that K=E[index] otherwise
- Proof
 - → The proof is by induction on n, the problem size.
 - \rightarrow The base case in n = 0.
 - → In this case, line 1 is true, line 2 is reached, and -1 is returned. (the postcondition is true)

Quicksort Error?

Program 5 error?

```
if(y == hand_y \&\& hand_x > x)
         direction = "North";
if(direction.equals("North")) {
       if(maze[hand_y][hand_x] == '#' && maze[y-1][x] == '.'){
       if(maze[hand_y][hand_x] == '.' && maze[y-1][x]=='#'){
```

```
if(y == hand_y \&\& hand_x > x)
         direction = "North";
if(direction.equals("North")) {
       if(maze[hand_y][hand_x] == '#' && maze[y-1][x] == '.'){
             //move forward
       if(maze[hand_y][hand_x] == "." && maze[y-1][x]== "#"){
            //turn right
```

```

38	27	43	3	9	82	10	14

$$N = 8$$

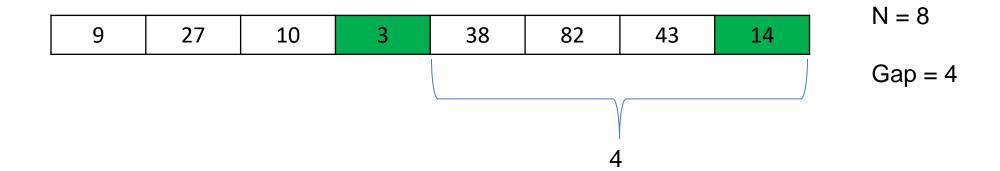

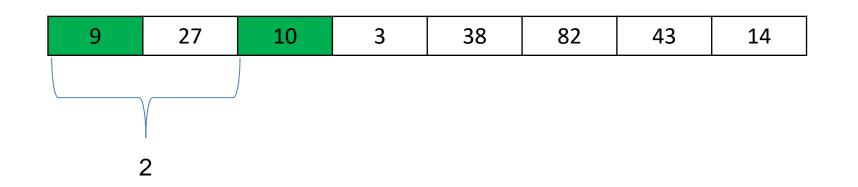

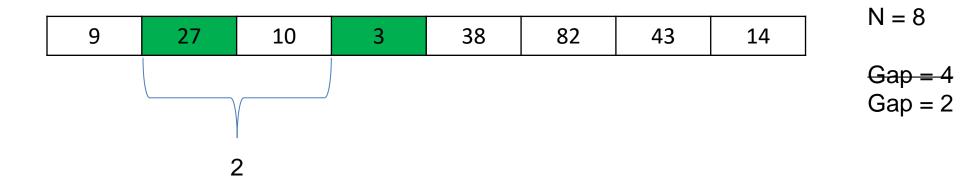

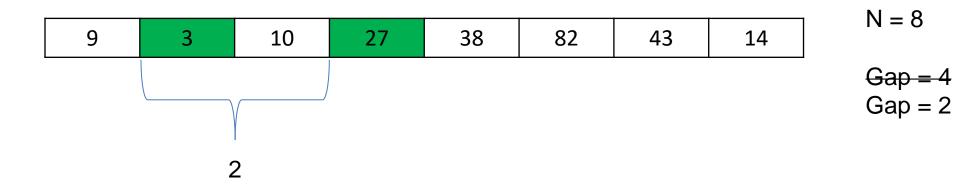

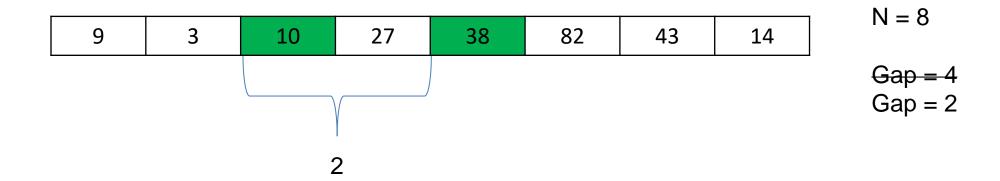

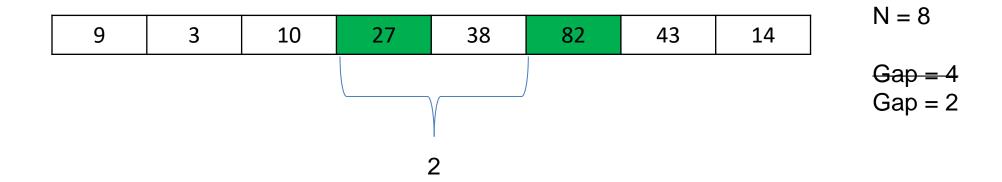

$$N = 8$$

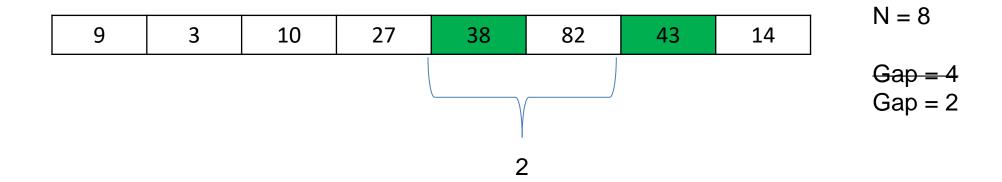

$$\frac{Gap = 4}{Gap = 2}$$

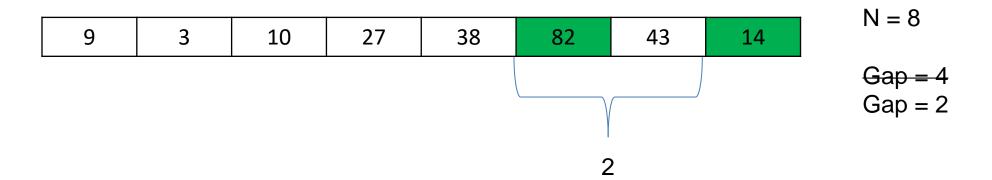

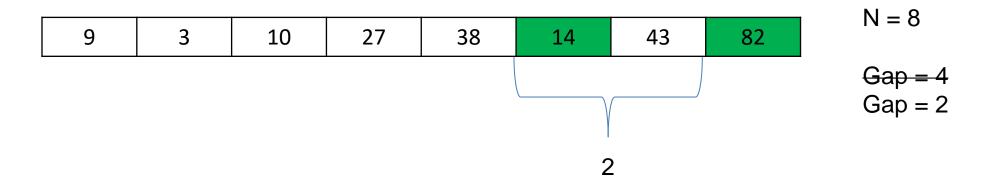

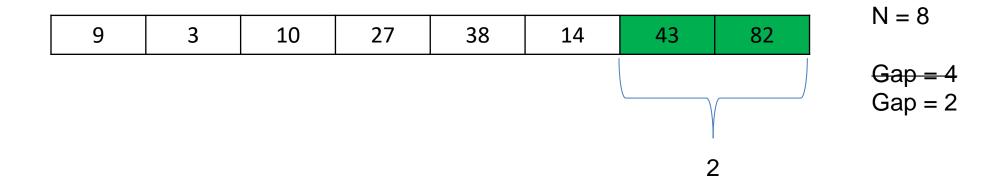

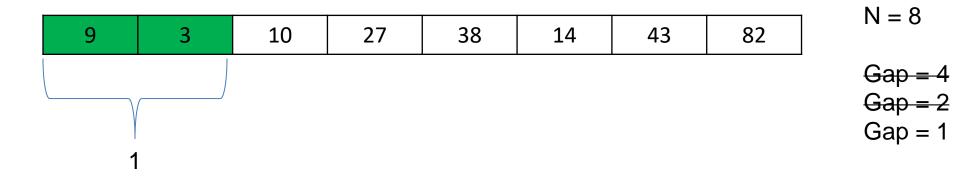

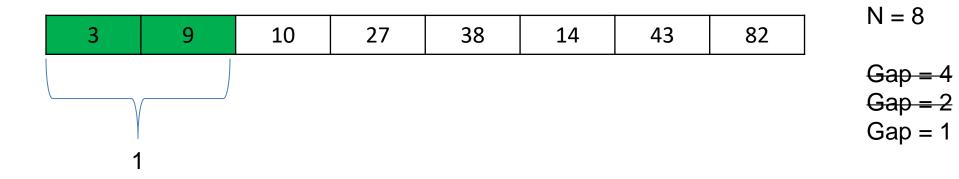

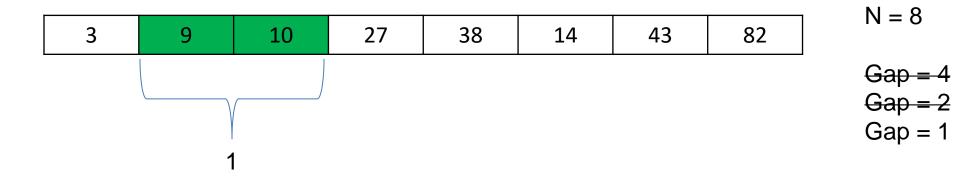

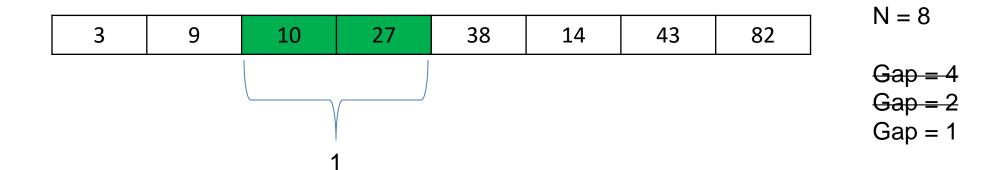

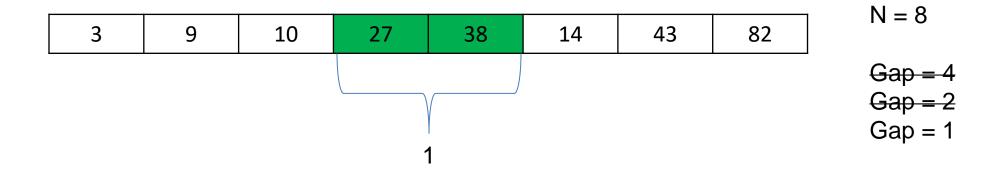

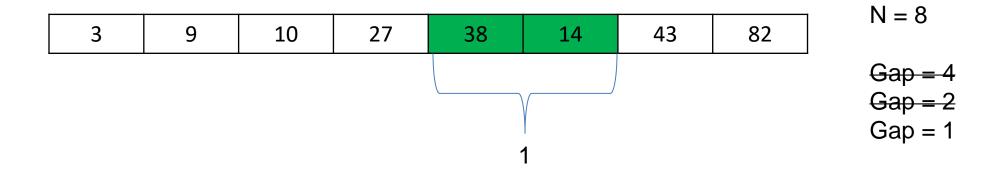

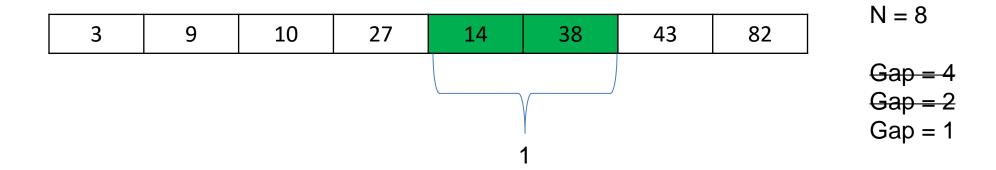

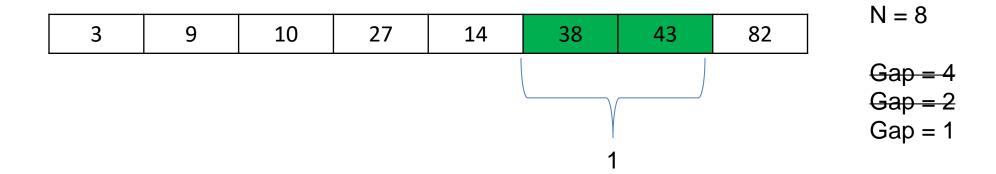

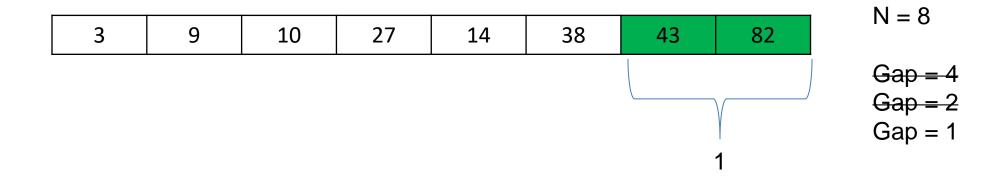

Compare items that are distant from each other. After each iteration, decrease the gap size.

3	9	10	27	14	38	43	82

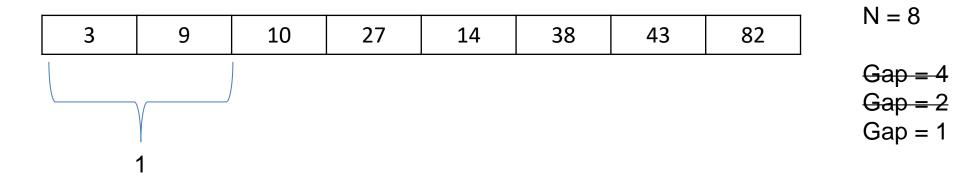

$$N = 8$$

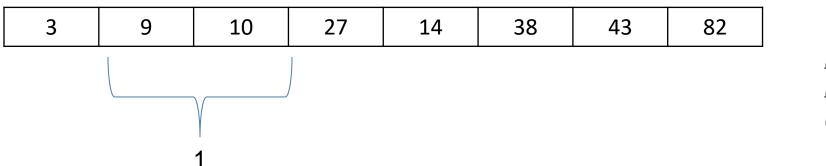

$$\frac{Gap = 4}{Gap = 2}$$

$$Gap = 2$$

$$Gap = 1$$

(do it again ??)

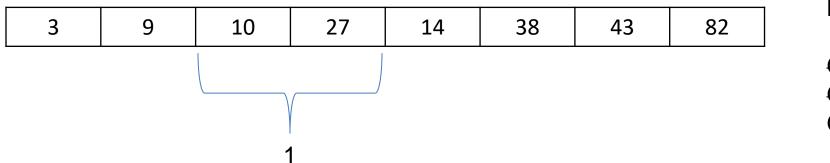

$$N = 8$$

$$Gap = 4$$

$$\frac{Gap = 4}{Gap = 2}$$

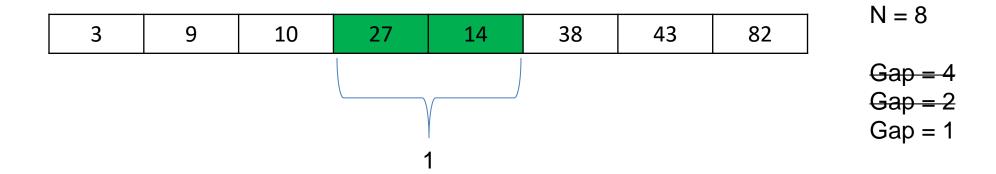

$$Gap = 1$$

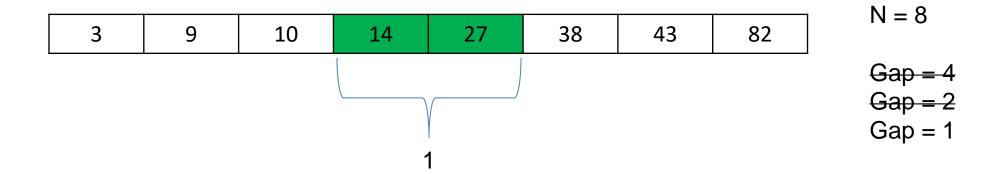

$$Gap = 4$$

$$\frac{Gap = 4}{Gap = 2}$$

$$Gap = 1$$

Compare items that are distant from each other. After each iteration, decrease the gap size.

$$Gap = 4$$

$$Gap = 2$$

$$Gap = 1$$

Running time: O(n²)

Cocktail Shaker Sort

Double Sided Bubble Sort

https://en.wikipedia.org/wiki/Cocktail_shaker_sort

Running time: O(n²)

Does anyone have any ideas for a very bad sorting algorithm, but still works?

Does anyone have any ideas for a very bad sorting algorithm, but still works?

If we are really lucky, our algorithm is insanely fast

If we are really unlucky, our algorithm will never finish

Bogo Sort (stupid sort) randomly shuffles the array until its sorted

```
while not sorted(array):
    shuffle(array)
```

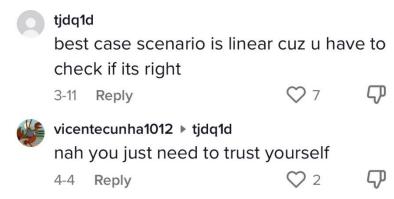

Running time: O(pain) if we don't keep track of permutations checked

O(n!) if we keep track of permuations

Bogo Sort (stupid sort) randomly shuffles the array until its sorted

while not sorted(array):
 shuffle(array)

Best case scenario, this is the most efficient sorting algorithm!

Running time: O(pain) if we don't keep track of permutations checked

O(n!) if we keep track of permutations

This sorting algorithm is a joke, please don't take this one seriously...
